This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       heart, kidney, etc, tissue environment and thereby, to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The
                                                                                                                                                                                                                                                                                                           Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted toucleic acids associated with lung airway or lung dysfunction, and
                                                                                                                                                                               Katz E, Pabalan J, Aguilar D;
                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 15; SEQ ID NO 6047; 763pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               prevent any unwanted effects due to it

(EPIG-) EPIGENESIS PHARM INC

Pabalan J, Aguilar D; Katz E, Li Y, Sandrasagra A, Ka Tang L, Shahabuddin S; Miller S, Nyce JW,

WPI; 2003-093058/08.

ဌ Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted toncleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 14162; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstruction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, conformation adenosine sensitivity, levels of adenosine (A) or (A) receptors, coligonucleotides are derived from a gene encoding or regulating coligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung expression of a target containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiastenation, of the invention as antiallergic, antiinflammatory, antiastenation, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasconomstriction, inflammation, andlergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasconomstriction, inflammation, allergies asthma, impeded respiratory diseress syndrome, pain, cystic fibrosis, altergic rhinitis, pulmonary transplantation rejection, pulmonary infections, bronchitis or cencer. Or thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, ecc, tissue environmen

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                 Human; antisense; bronchoconstriction; allergy; hyposecretion; pain; respiratory tract inflammation; adenosine sensitivity; lung; cancer; surfactant depletion; antiallergic; antiinflammatory; antiasthmatic; analgesic; hypotensive; immunosuppressive; cytostatic; cystic fibrosis; beta-adrenergic agonist; respiratory disease; pulmonary vasoconstriction; respiratory distress syndrome; allergic rhinitis; pulmonary hypertension; emphysema; chronic obstructive pulmonary disease; cancer; bronchitis; pulmonary transplantation rejection; ss; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a analgesic, hypotensive, immunosuppressive and cytostatic activity, is a creating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. WPI; 2003-093058/08.

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 8454; 763pp; English,

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating

dysfunction or cancer and can be anti-sense to the corresponding mRNA.

The invention also describes a kit, that comprises: (a) a delivery
device, in separate containers, (b) the oligonucleotides, (c)
instructions for adding a carrier and for use of the kit. The composition
of the invention has antiallergic, antiinflammatory, antiasthmatic,
analgesic, hypotensive, immunosuppressive and cytostatic activity, is a
beta-adrenergic agonist. The composition is useful for preventing or
treating a respiratory, lung or malignant disease. The administered
composition comprises oligo and is administered to reduce the production
or availability, or to increase the degradation of the target mRNA or to
reduce the amount of target polypeptide present in the lungs. The
collemnation, allergies and/or bronchoconstriction and/or lung
inflammation, allergies and/or bronchoconstriction are associated
with a disease or condition such as pulmonary vasoconstriction,
inflammation, allergies and/or bronchoconstriction, respiratory
distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary
cransplantation rejection, pulmonary infections, bronchitis or cancer.
The reduced adenosine content of the anti-sense oligos corresponding to
thymidines present in the target RNA serves to prevent the breakdown of
thymidines present in the target that free adenosine into the system ö e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it expression of a target polypeptide associated with lung airway or lung Gaps . 0 Score 15.8; DB 1; Length 20; Pred. including autoimmune diseases, infectious diseases, graft versus host diseases, hypersensitivity diseases, infectious diseases, and neoplastic diseases. Autoimmune diseases include Addison's disease, atrophic gastritis. Degenerative nervous system diseases include multiple atrophic gastritis. Degenerative nervous system diseases include multiple sclerosis and Alzheimer's disease. Hypersensitivity diseases include Type I hypersensitivities such as those present in Goodpasture's syndrome and Type IV hypersensitivities such as those caused by an infections of the yeast genus Candida, parasitic infections such as those caused by schistosomes, filaria and bacterial infections such as those caused by Mycobacterium. Neoplastic diseases include lymphoproliferative diseases such as leukaemias, lymphomas and cancers such as cancer of the brain, breast. The present sequence represents a Vbeta gene repeat sequence.
                                                                      Kit for diagnozing and treating T-cell associated diseases e.g. autoimmune, degenerative nervous system and infectious disease, comprises nucleic acid primers specifically priming and allowing amplification of a

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human glucocorticoid receptor-specific antisense oligonucleotide #4567
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                      The invention relates to a kit for diagnosing and treating T-cell associated diseases which comprises a panel of nucleic acid primers specifically priming and allowing amplification of each Vbeta gene, VbetaRNA or CDNA. The kit is useful for diagnosing organ transplant rejection and diagnosing and treating T-cell associated diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ;

                                                                                                                                      The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothicate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.
contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       antisense oligonucleotide; glucocorticoid receptor; infection; inflammation; tumour formation; diabetes; obesity; cardiovascular disorder; hyperlipidaemia; Cushing's syndrome; human; ss; phosphorothioate backbone; 2'-methoxyethyl; 2'-MOE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human glucocorticoid receptor-specific antisense oligonucleotide #4537

targeted to, and which specifically hybridises with, a nucleic acid molecule encoding 3-hydroxy-3-methylglutaryl-Coentyme A (HMG-CoA) reductase, and inhibits the expression of HMG-CoA reductase. The novel compounds have cardiant, antiarteriosclerotic, and antilipaemic activities. The compound can be used to treat disorders by antisense gene therapy. The compounds, compositions and methods are useful for treating a disease or condition associated with HMG-CoA reductase, such as a cardiovascular disorder e.g. atherosclerosis, or a disease or condition involving cholesterol metabolism. They are also useful in research and diagnostics for modulating the expression of HMG-CoA reductase. This polynucleotide sequence represents an antisense oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             HMG-CoA reductase; 3-hydroxy-3-methylglutaryl-Coenzyme A;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                    The invention relates to novel compounds of 8-80 nucleobases in length targeted to, and which specifically hybridises with, a nucleic acid molecule encoding 3-hydroxy-3-methylglutaryl-Coenzyme A (HMG-CoA) reductase, and inhibits the expression of HMG-CoA reductase. The novel compounds have cardiant, antiarteriosclerotic, and antilipaemic activities. The compound can be used to treat disorders by antisense gene therapy. The compounds, compositions and methods are useful for treating a disease or condition associated with HMG-CoA reductase, such as a cardiovascular disorder e.g. atherosclerosis, or a disease or condition involving cholesterol metabolism. They are also useful in research and diagnostics for modulating the expression of HMG-CoA reductase. This polynucleotide sequence represents an antisense oligonucleotide of the

The present invention relates to an oligonuclectide anti-sense to e.g., initiation codon, coding region with 2-10 nuclectides of 5'-end and 3'-end of nucleic acid target comprising gene(s) chosen from e.g. interleukin (IL)-4 receptor, IL-5 receptor or salts of the coligonuclectide and optionally surfactant operatively linked to the oligonuclectide. The method is useful for preventing or treating a respiratory or lung disease, which involves administering to the airways of a subject an effective amount of an inhibitor. The oligonuclectide is cof a respiratory or lung disease. The respiratory or lung disease is chosen from airway inflammation, allergy(ies), asthma, impeded respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases (COPD), allergic rhinitis (AR), acute respiratory distress syndrome (ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway obstruction. The present sequence represents an oligonuclectide of the

The invention relates to a method for treating airway hyperresponsiveness or pulmonary inflammation in an individual comprising administering an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein. The invention also relates to a method of inhibiting expression of a nucleic acid molecule encoding B7-1 or B7-2. The antisense compound is an antisense oligonucleotide which has a modified sugar moiety and nucleobase. The human B7 protein is human B7-1 or B7-2 protein or both. The compound is useful for treating airway hyperresponsiveness or pulmonary inflammation, which is associated with asthma, by inhibiting expression of human B7 protein. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ss; primer; diagnosis; cervical intraepithelial neoplasia; CIN; allelic deletion; FHIT; fragile histidine triad gene; PR; progesterone receptor; DLEC1; deleted in lung and oesophageal cancer 1; TRIM29; tripartite motif-containing 29; microsatellite; D3S1300; D3S1260; D11S35; D11S528.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Diagnosing cervical intraepithelial neoplasia comprising detecting an allelic deletion in genes selected from FHIT, PR, DLEC1- or TRIM 29 by comparing the FHIT, PR, DLEC1 and/or TRIM 29 polynucleotides or proteins present in the samples.
                                                                                    Treating airway hyperresponsiveness or pulmonary inflammation comprises administering an antisense compound targeted to a nucleic acid molecule encoding a human B7 protein to the individual.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0.4%; Score 15.8; DB 1; Length 20; 39.5%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to an oligonucleotide anti-sense to e.g.,
initiation codon, coding region with 2-10 nucleotides of 5'-end and 3'-
end of nucleic acid target comprising gene (s) chosen from e.g.
configuration (IL)-4 receptor, IL-5 receptor or salts of the
coligonucleotide and optionally surfactant operatively linked to the
coligonucleotide. The method is useful for preventing or treating a
respiratory or lung disease, which involves administering to the airways
cof a subject an effective amount of an inhibitor. The oligonucleotide is
cof a subject an effective amount of an inhibitor. The oligonucleotide is
cof a respiratory or lung disease. The respiratory or lung disease is
chosen from airway inflammation, allergy(les), asthma, impeded
respiration, cystic fibrosis (CF), chronic obstructive pulmonary diseases
(COPD), allergic rhinitis (AR), acute respiratory distress syndrome
(ARDS), pulmonary hypertension, lung inflammation, bronchitis, airway
cobstruction. The present sequence represents an oligonucleotide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

This sequence represents a primer which was used in the method of the invention for diagnosing susceptibility to persistence or progression of cervical intraepithelial neoplasia (CIN) in an individual suffering from the disease. The method comprises detecting an allelic deletion in one or more genes selected from FHIT (fragile histidine triad gene), PR (progesterone receptor), DLEC1 (deleted in lung and oesophageal cancer 1) or TRIM29 (tripartite motif-containing 29) by comparing the FHIT, PR, or TRIM29 (tripartite motif-containing 29) by comparing the FHIT, PR, or TRIM29 (tripartite motif-containing 29) by comparing the FHIT, PR, or TRIM29 (tripartite motif-containing 29) by comparing the FHIT, PR, or primers, where each pair of primers is suitable for amplifying a microsatellite DNA marker selected from D3S1300, D3S1260, D11335 or D115528, or a panel of two or more specific binding agent is capable of distinguishing between the normal and allelic deletion forms of a polynucleotide or protein selected from FHIT, PR, TRIM29 or DLEC1. The method is useful for diagnosing susceptibility to persistence or progression of cervical intraepithelial neoplasia in an an individual suffering from the disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antisense therapy; human; Fas; Fas ligand; FasL; Apo-1L; CD95L; Fas associated protein 1; Fap-1; signal transduction; autoimmune disease; inflammatory disease; cancer; immunosuppressive; antiinflammatory; cytostatic; phosphorothioate; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense oligonucleotides of 20-50 nucleobases, useful for treating autoimmune or inflammatory diseases, and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /mod_base= OTHER
/note= "This oligonucleotide has a phosphorothioate
backbone and 2'-methyoxyethyl (2'-MOE) wings at the 5'
and 3' ends, which are 5 nucleotides in length at each
end. All cytidine residues are 5-methylcytidines"
                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                      .

The present invention relates to antisense compounds targeted to nucleic acids encoding human Fas (also known as Apo-1 or CD95), Fas ligand (FasL, also Apo-1L and CD95L), and Fas associated protein 1 (Fap-1). The antisense compound comprises an antisense oligonucleotide that specifically hybridises with one of the said nucleic acids and inhibits FasL or Fap-1 mediated signal transduction. The antisense oligonucleotide is a chimeric oligonucleotide. The antisense oligonucleotide comprises at least one modified sugar moiety, preferably a 2'-0-methoxyethyl (2'-MOE) sugar moiety, preferably a 2'-0-methoxyethyl (2'-MOE) sugar moiety, preferably a 5-methylcytosine. The antisense oligonucleotide further comprises at least one modified nucleobase, preferably a 5-methylcytosine. The antisense oligonucleotide sare useful for the treatment of autoimmune or inflammatory diseases, and cancers associated with overexpression of or constitutive activation of Fas, FasL, or Fap-1. The present sequence represents an antisense oligonucleotide used in the examples of the
                                                                                                                                                                                                                                                                                                                                                                                                               ô

```
The invention describes an antisense compound 8-30 or 8-50 nucleobases in length targeted to the 5'-untranslated region, translational start site, translational termination region or 3'-untranslated region of a nucleic acid molecule encoding Fas, Fas ligand or Fap-1. Also described are: a pharmaceutical composition comprising the anti-sense compound and a pharmaceutical carrier or diluent; a method of inhibiting the expression of Fas or Fap-1 in cells or tissues: treating an animal having a disease or condition associated with Fas or Fap-1; anda preventing allograft rejection, ischaemia reperfusion injury or apoptosis in an allograft recipient. The antisense compound and pharmaceutical composition is useful in diagnosing, treating or preventing autoimmune or inflammatory disease, e.g. hepatitis, cancer, e.g. cancer of the colon, liver, lung or a lymphoma, apoptosis, allograft rejection, e.g. cardiac, renal, hepatic or skin allograft and ischemia reperfusion injury. This sequence
                                                                                                                                                                                                        New antisense compound targeted to nucleic acid molecule encoding Fas or Fap-1, useful in diagnosing, treating or preventing autoimmune or inflammatory disease, cancer, apoptosis, allograft rejection or ischemia reperfusion injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     represents a human Fas antisense oligonucleotide
                                                                                                                            Ë

23-APR-2002; 2002WO-US013135

The invention relates to oligonucleotides anti-sense to an initiation codon, coding region, 5' or 3' intron-exon junction, intron or region with 2-10 nucleotides of the 5'-end or 3'-end of a nucleic acid target chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL) chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL) chosen from a gene encoding interleukin (IL)-4 receptor, interleukin (IL) case introductor, CCR1, CCR3, Extending a candidate compound that binds to come or more nucleic acid target(8) or expressed product(8), for the prevention and/or treatment of a respiratory or lung disease. The coligonucleotides are useful for reducing or inhibiting expression of a coligonucleotides are useful for receptor, interleukin-5 receptor, candidate b, PDE4 A, PDE4 B, PDE4 C, or PDE4 D. The oligonucleotides are useful for preventing or treating a respiratory or lung disease. The respiratory or lung disease is associated with hyper-responsiveness to and/or increased levels of, adenosine and/or levels of, adenosine and/or lung allergies associated with inflammation or an inflammation, allergies associated with inflammation or an inflammation, allergy, asthma, impeded respiration, cylicic fibrosis (CF), chronic observative pulmonary disease (COPD), and observative disease (COPD), and observative disease (COPD), and observative disease (COPD), and observative disease (COPD). Novel single or multiple target oligonucleotide anti-sense to e.g. cCR1, initiation codon, intron of respiratory disease-relevant gene e.g. CCR1, RANTES, MCP4, useful for prophylaxis or treating respiratory disease e.g. Gaps aîlergic rhinitis, acute respiratory distress syndrome, pulmonary hypertension, lung inflammation, bronchitis, airway obstruction or bronchoconstriction.                                                                                                                             ADAM15; metagirdin; MDC15; a disintegrin and metalloproteinase domain 15; diagnosis; inflammation; therapy; human; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                to ADAM15 (otherwise known as metagirdin, MDC15, and adisintegrin and metalloproteinase domain 15) and which modulate the expression of ADAM15. The invention is useful for diagnosing and treating diseases associated with expression of ADAM15 such as inflammation. The present sequence is human ADAM15 target oligonucleotide. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention is directed to antisense oligonucleotides targeted
                                                                                                                                                                                                                                                                                                                                                                                                            New compound targeted to a nucleic acid molecule encoding ADAM15 and inhibits the expression of ADAM15, useful for modulating the expression of ADAM15 or for diagnosing or treating, e.g. inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

                                                                                                                                                                                                                                                                                                                             The present invention is directed to antisense oligonucleotides targeted to ADAM15 (otherwise known as metagirdin, MDC15, and a disintegrin and metalloproteinase domain 15) and which modulate the expression of ADAM15. The invention is useful for diagnosing and treating diseases associated with expression of ADAM15 such as inflammation. The present sequence is human ADAM15 antisense oligonucleotide. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                      New compound targeted to a nucleic acid molecule encoding ADAM15 and inhibits the expression of ADAM15, useful for modulating the expression of ADAM15 or for diagnosing or treating, e.g. inflammation.

The invention describes a compound 8-80 mucleobases in length targeted to a mucleic acid molecule encoding Cytokine-inducible kinase. The compound specifically hybridises with the nucleic acid molecule encoding Cytokine-inducible kinase (which comprises a sequence of 2169 bp fully defined in the specification) and inhibits the expression of Cytokine-inducible kinase in cells or tissues, comprising contacting the cells or tissues with the new compound so that the expression of Cytokine-inducible kinase is inhibited; a method of screening for a modulator of cells or tissues with the new compound so that the expression of Cytokine-inducible kinase, comprising contacting a preferred target of cytokine-inducible kinase, comprising contacting a preferred target of cytokine-inducible kinase, and identifying one or more modulators that modulate the expression of identifying one or more modulators that modulate the expression of cytokine-inducible kinase, a diagnostic method for identifying a disease or comprising the above compound; and a method of treating an animal comprising the above compound; and a method of treating an animal comprising administering to the animal a therapeutic or prophylactic amount of the compound so that expression of Cytokine-inducible kinase is inhibited. The antisense oligonucleotide is useful for inhibiting the expression of Cytokine-inducible kinase expression such as the compound is used for treat diseases associated with the kinase expression, such as comprised to the animal and compound is used for the compound disorders. In addition, the compound is used for the compound disorders. In addition, the compound is used for the compound disorders. In addition, the compound is used for the compound disorders. In addition, the compound disorders in the compound disorders in the compound disorder
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    diagnostics, prophylaxis, or as research reagents or kits. This sequence represents a human cytokine-inducible kinase antisense oligonucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense oligonucleotides useful for modulating Cytokine-inducible kinase expression, useful for diagnosing, preventing or treating conditions associated with aberrant kinase expression e.g. hyperproliferative disorders.
                                  Phosphorothioate backbone. All cytidines
                                                                                                                                                                                                                                                                                                                                                                             /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, bacterial or fungal infection. The present sequence represents a primer for a 50 mer oligonucleotide marker for diagnosis and monitoring of allograft rejection and other disorders.

The invention describes a method of identifying (M1) a subject at risk of breast cancer. The method comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject. The methods, nucleic acids, proteins, and compositions are useful for diagnosing, preventing, and treating breast cancer. Also described is a method useful for identifying candidate therapeutics for treating breast cancer. This sequence represents a primer used to analyse polymorphisms associated with breast
                                                                                                                                                                                                                                                                                                                                                                                                                                            Identifying a subject at risk of breast cancer comprises detecting the presence or absence of one or more polymorphic variations associated with breast cancer in a nucleic acid sample from a subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               antimicrobial; antidiabetic; antirheumatic; antiarthritic; gastrointestinal; antiinflammatory; neuroprotective; dermatological; virucide; hepatotropic; human; TNF-alpha; tumour necrosis factor alpha; survivin; TNF-alpha associated disorder; infection; diabetes; rheumatoid arthritis; Crohn's disease; pancreatitis; multiple sclerosis; atopic dermatitis; hepatitis; antisense oligonucleotide;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                        The invention describes a double stranded RNA compound 8-80 nucleobases in length targeted to a nucleic acid molecule encoding human TNF-alpha, where the compound specifically hybridises with the nucleic acid molecule encoding TNF-alpha and inhibits the expression of survivin. Also described is a double stranded RNA compound having a fully defined sequence of 20 bp (SEQ ID NO: 432) as given in the specification. Also disclosed are TNF-alpha polypeptides, host cells, vectors and antibodies used in the methods of the invention. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of TNF-alpha, such as infection, diabetes, rheumatoid arthritis, Crohn's disease, pancreatitis, multiple sclerosis, atopic dermatitis and hepatitis. This sequence represents a human tumour necrosis factor alpha (TNF-alpha) antisense oligonucleotide.
                                                                                                                                                                                                                                                                            and survivin, useful for diagnosing, preventing or treating infection, diabetes, arthritis, multiple sclerosis and hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; tumour necrosis factor alpha; TNFalpha; ss;

The invention relates to treating an inflammatory disorder in an individual comprising administering an oligonucleotide (an antisense oligonucleotide) up to 30 nucleotides in length complementary to a nucleic acid molecule encoding human tumour necrosis factor-alpha (TNF-alpha). The oligonucleotide useful in treating an inflammatory disorder inhibits the expression of the human tumour necrosis factor-alpha, and comprises at least an 8 nucleobase portion of any of 50 20-21 base pair sequences, given in the specification. The antisense oligonucleotide is sequences, given in the specification. The antisense oligonucleotide is comprises at least one modified intersugar linkage. The intersugar linkage is a phosphorothioate linkage. The oligonucleotide further comprises at least one 2'-0-methoxyethyl modification and at least one 5-methyl cytidine, where every 2'-0-methoxyethyl modified cytidine residue is a 5-methyl cytidine, and where every cytidine residue is a 5-methyl cytidine, and where every cytidine residue is a 5-methyl cytidine, and where every cytidine residue is a 5-methyl cytidine, and where every cytidine residue is a 5-methyl cytidine, and where every cytidine residue is a secolated with aberrant expression or activity of the TNF-conditions associated with aberrant expression or activity of the TNF-conditions all and all and activity of the cytician all all and activity of the conditions all and activity of the cytician all and activity of the cytician all and activities and autoimmune diseases or conditions associated with aberrant expression or activity of the TNF-cytician all and cyticians and autoimmune diseases or conditions associated with aberrant expression or activity of the cytician and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ..

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ద
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention provides methods for identifying an Epstein Barr Virus (EBV) infection, that comprises determining viral gene transcription patterns by amplification of specific RNA sequences. The binding sites of the oligos suitable for amplification are located in the following genes: Epstein Barr early RNA (EBER-1), Epstein Barr nuclear antigen 1 (EBNA-1). latent membrane protein 1 (LMP-1), LMP-2, and vIL10 (BCRF-1), BARF1 and BDLF2. The method comprises (a) amplifying a target sequence within one or more RNA(s) transcribed from above gene sequences and the (b) detecting the amplified products, determining the transcription pattern and identifying the corresponding EBV-associated malignancy. The RNA is amplified using a transcription based amplification technique such as NASBA. The invention is used to diagnose malignant and non-malignant EBV-associated diseases. Sequences AAZ11672-75 represent oligos specific for BARF-1 RNA. (Updated on 27-AUG-2003 to correct OS field.)

AAV72085-V72099 represent PCR primers and probes used in the isolation and amplification of novel human and murine macrophage stimulating protein, MSP, which are used in a method for the prophylactic treatment of a tumour derived from neuroendocrine cells (NEC) by administration of this MSP to a subject at risk, sufficient to induce apoptosis of NEC expressing a RON receptor (the receptor for MSP). The method is used to treat or prevent small cell lung carcinoma and apoptosis of RON-expressing cells may be induced in vivo or in vitro. Screening NEC from a subject for susceptibility to MSP-induced apoptosis is used to identify patients who will benefit from treatment with the MSP protein. MSP is already known for treating pathogen infections, for stimulating thrombocyte production and megakaryocyte maturation (for treating transfer of the cells (particularly contraction).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; collagen; COL1A1; COL1A2; COL9A1; COL9A2; COL9A3; ss; osteoporosis; multiple epiphyseal dysplasia; osteogenesis imperfecta; shortness of stature; low bone density; gene therapy; PCR primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Treating tumours derived from neuroendocrine cells with macrophage stimulating protein - or its nucleic acid, also for preventing development of these tumours, specifically small cell lung carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ..

The invention relates to Detecting a collagen gene alteration associated with a pathological condition in a human subject by obtaining from the subject a sample nucleic acid containing a portion of at least 15 consecutive nucleotides of the segment of the COLLA1 gene extending in the 5' to 3' direction from 78 nucleotides of intron 27 located adjacent exon 28 through the 1' end of intron 51, where the portion contains an intronic nucleotide and a first and second site, determining the sequence of the portion and comparing the sequence of the portion with the corresponding consensus sequence of the COLLA1 gene where a difference of the portion and the consensus sequence indicates the presence of the portion and the consensus sequence indicates between the sequence of the portion and the consensus sequence indicates corresponding whether a subject is afflicted with pathological conditions used for detecting abnormalities in a COLL or COL9 gene is useful for determining whether a subject is afflicted with pathological conditions associated with an altered collagen gene such as osteoporosis, multiple epiphyseal dysplasia, osteogenesis imperfecta, shortness of stature and low bone density. Identification of an abnormality in a collagen gene is also useful for designing a therapeutic nucleotide or gene therapy agent which can be administered to the subject to correct or alleviate the abnormality. The method is useful for detecting mutations in both the coding and non-coding sequences of any of the COL1 or COL9 genes.

Therefore the method can be used to detect collagen gene alterations which affect either the primary sequence of a collagen protein chain, splicing of the mRNA encoding such chains or regulation of expression of the genes encoding such chains or regulation of expression of the genes encoding such chains or collagen gene is nucleic acid from a collagen gene of a collagen.
                                                                                                                                                                                                                                                                                                          Detecting collagen gene alteration, useful for diagnosing osteoporosis, multiple epiphyseal dysplasia, osteogenesis imperfecta, shortness of stature and low bone density in humans.
                                                                                                                                                                     Koerkkoe J;

New NOVX polypeptides or polynucleotides, useful for preventing or treating disorders or syndromes e.g., atherosclerosis, hypertension obesity or cancer

ö

Example 2; Page 855; 923pp; English

The present invention relates to novel human NOVX proteins, where X is any number from 1 to 91 and their coding sequences (see ADH48717-ADH48930). The proteins and coding sequences are useful for preventing or treating disorders or syndromes e.g. atherosclerosis, hypertension, obesity or cancer. The present sequence was used in an example from the invention.

enzymatic nucleic acid, especially a hammerhead ribozyme, which cleaves the human c-myb sequence as the base position indicated in the descriptor line. The c-myb sequence was screened for optimal ribozyme target sites using a computer folding algorithm, and regions of the mRNA which did not form secondary folding structures and contained potential ribozyme cleavage sites were identified. Ribozymes were synthesised and their activities optimised by either varying the length of the binding arms or by modification to prevent degradation by nucleases. The ribozymes cleave the c-myb sequence and can be used to prevent smooth muscle cell hyperproliferation in restenosis, especially after coronary angioplasty,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Single nucleotide polymorphism; SNP; human; genetic disease; disease susceptibility; cardiovascular system; endocrine system; neurological system; forensic testing; paternity testing; PCR primer; ss.
                                                                                                                                                                                                                                                                                                              New enzymatic nucleic acid molecules - cleave RNA produced by e.g. c-myb, for treating restenosis or cancer.

                                                                               The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention is concerned with a number of human single nucleotide polymorphisms (SNPs) which the inventors identified in human genes. These SNPs can be used in disease diagnosis and prediction of an individual's susceptibility to disease, in forensic and paternity testing and in genetic mapping. In particular, the SNPs of the invention can be used to diagnose susceptibility to diseases of the cardiovascular, endocrine and neurological systems, such as coronary artery disease, schizophrenia, cancer, autoimmune diseases, Alzheimer's and Parkinson's

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

The invention relates to nucleic acid molecules that modulate replication of the West Nile Virus (WNV). The nucleic acid molecules are useful for treating a condition related to WNV infection e.g. pancreatitis, encephalitis, myocarditis, meningitis, neurologic infection, hepatitis, liver failure, hepatocellular carcinoma or cirrhosis. The nucleic acid molecule is selected from the group of ribozymes consisting of Hammerhead, Inozyme, G-cleaver, DNAzyme, Amberzyme and Zinzyme. The nucleic acid molecules further comprise at least five ribose residues, at least three of the 5' terminal nucleotides and a 3' end modification of a 3'-3' inverted abasic moiety. Nucleic acid molecules SEQ ID NO 1 to 37080 are claimed; however, SEQ ID NO 2194-2206 and 17502-17514 are not given in the specification. The present sequence is that of a nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid molecule that modulates replication of West Nile Virus (WNV), useful for treating a condition related to WNV infection e.g. pancreatitis, meningitis, hepatocellular carcinoma or cirrhosis.

The invention relates to a novel isolated 17 mer nucleic acid sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence with, after optimal calignment, at least 80 % identify to the 17 mer sequence, a sequence that hybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated nucleic component of a gene chip, in vitro as (anti)sense reagents, and for component of a gene chip, in vitro as (anti)sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, cells containing the nucleic acids corresponded to pharmaceuticals for prevention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. Analysis of the expression of the 17 mer nucleic acids in diseases. The polypeptides can also be used to generate antibodies, and chips. The nucleic acid sequences of the invention can be used in gene therapy. This polynucleotide sequence represents a tumour suppression cycle related human fukutin oligonucleotide of the invention

```

Lee P;

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HBV) RNA. The nucleic acid molecules include antisense and enzymatic nucleic acids such as hammerhead ribozymes, DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV compounds and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HBV riscladed in the present zinzyme, DNAzyme or amberzyme sequences

The nucleic acids are useful for treating hepatitis B virus infection, hepatitis, hepatocellular carcinoma, cirrhosis and liver failure, either alone or in combination with other therapies such as lamivudine and interferons. The nucleic acids are useful as diagnostic tools to examine genetic drift and
that modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocellular carcinoma. The present sequence represents a substrate for one of the HBV sibozyme, inozyme, Goleaver, zinzyme, DNAzyme or amberzyme sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          specifically cleaving RNA derived from hepatitis B virus and comprising one or more binding arms, useful for treating hepatitis and cirrhosis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an enzymatic nucleic acid molecule that specifically cleaves RNA derived from hepatitis B virus (HBV) and comprising one or more binding arms, without requiring the presence of a 2'-OH group within the molecule for activity. The nucleic acids are useful for treating hepatitis B virus infection, hepatitis, hepatocellular carcinoma, cirrhosis and liver failure, either alone or in combination with other therapies such as lamivudine and interferons. The nucleic acids are useful as diagnostic tools to examine genetic drift and mutations within diseased cells, for detecting the presence of HBV RNA in
mutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of target genes in bacterial, fungal, viral, plant or mammalian cells. This sequence represents an HBV RNA target sequence, used in the scope of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at sequata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes specifically cleaving RNA derived from hepatitis B virus and comprising one or more binding arms, useful for treating hepatitis and cirrhosis.

a cell, for the study of RNA and for down-regulating gene expression of target genes in bacterial, fungal, viral, plant or mammalian cells. This sequence represents an HBV RNA target sequence, used in the scope of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at seqdata.uspto.gov/sequence.html.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       gene expression; downregulation; interleukin-5; IL-5; ICAM-1; intercellular adhesion molecule; rel A; tumour necrosis factor; TNF-alpha; respiratory syncytial virus; RSV; bcr-abl; oncogene; translocation; chronic myelogenous leukaemia; CML; cancer; Philadelphia chromosome; inflammation; autoimmune disease; atherosclerosis; myocardial infarction; stroke; restenosis; transplant rejection; rheumatoid arthritis; psoriasis; myocardial ischaemia; Kawasaki disease; septic shock; HIV; human immunodeficiency virus; acquired immune deficiency syndrome; AIDS;

Regions of the mRNA that do not form secondary folding structures and that contain potential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease resistance. The ribozymes are designed to cleave the target sequences and thereby inhibit TNF-alpha expression, making them potentially useful for treating rheumatoid arthritis, septic shock and other inflammatory disorders including psoriasis, as well as for treatment of AIDS. (Updated on 25-MAR-2003 to correct PI field.)

A new method for detection of nucleic acids in aqueous solution is claimed, which may be used for length analysis of repeat unit containing sections of microsatellite markers or other repetitive elements. The method may also be used for microorganism detection, parallel detection of several target nucleic acids using several primer pairs for enzymatic amplification and/or several differently labelled detection probes and/or 2nd probes, genotype determination, determining relatedness of organisms, clinical diagnosis, food chemistry, anthropology, forensic analysis, specific quantification of nucleic acids, determining the RNA concentration of tumour markers, determining nucleic acid sequences for antigenic determinants, nucleic acid sequence analysis, mutation analysis and determining genetic changes involved in the development of drug resistance. AAT61997-62000 are species specific probes for detection of Auxis thazard using the new method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 18 BP; 3 A; 4 C; 5 G; 6 T; 0 U; 0 Other;

Oligonucleotide sequences which bind nuclear proteins and surfactants found in lung cells, useful for detecting cancers that originate in the Example 2; Fig 10a; 76pp; English.

The invention relates to an oligonucleotide which includes at least 1 nucleic acid sequence which binds to at least 1 nuclear protein found in lung cells (e.g. the thyroid transcription factor 1, TTF-1, protein). The oligonucleotide can be expressed in lung cells via a vector and can be used to target therapeutic agents to kill lung or thyroid cancer cells. The oligonucleotide can be used to detect or diagnose lung or thyroid cancer. The oligonucleotides may be designed from the sequences of, for

The invention relates to an oligonucleotide which includes at least 1 nucleic acid sequence which binds to at least 1 nuclear protein found in lung cells (e.g. the thyroid transcription factor 1, TTF-1, protein). The oligonucleotide can be expressed in lung cells via a vector and can be used to target therapeutic agents to kill lung or thyroid cancer cells. The oligonucleotide can be used to detect or diagnose lung or thyroid cancer. The oligonucleotides may be designed from the sequences of, for example, the promoters of lung-specific genes such as those encoding surfactant proteins. The present sequence is a Human surfactant protein B, SPB, probe 5'fl based on the SPB-fl probe and is used to identify TTF-1 and HNF-3 binding sites in the SPB promoter using EMSA, electrophoretic

New nucleic acid, useful in imparting disease resistance to a plant or in preparing a composition for treating cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to the isolation of Pseudomonas syringae pv. tomato DC3000 Avr/Hop proteins, and the polynucleotide sequences encoding them. Also disclosed are expression vectors, host cells, and transgenic plants comprising polynucleotide sequences of the invention. The polynucleotide and polypeptide sequences are useful in imparting disease resistance to a plant or in preparing a composition for treating cancer. The sequences may also be used to make a plant hypersusceptible to colonisation by nonpathogenic bacteria, modify a metabolic pathway in a cell, cause eukaryotic cell death, and inhibit programmed cell death. The present sequence represents a PCR primer used in the examples of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to nucleic acid probes, which are useful for assaying nucleic acids by hybridising with a target nucleic acid, in which a single-stranded oligonucleotide is labelled with a fluorescent substance and a quencher in a manner that the fluorescence intensity of the hybridisation reaction system is increased after completion of the hybridisation but no stem loop structure is formed. The probes are useful for assaying nucleic acids and their polymorphism and mutation, particularly useful for e.g. analytical applications, disease diagnosis and microbial identification. The present sequence was used to illustrate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Fluorescently-labeled nucleic acid probes for assaying nucleic acids and their polymorphism and mutation, particularly useful in science and medicine for e.g. analytical applications, disease diagnosis and microbial identification.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to novel Pseudomonas Avr and Hop genes, a sequence that hybridizes with these sequences under stringency conditions comprising a hybridization medium that includes 0.9 x saline sodium citrate (SSC) buffer at a temperature of 42 deg C. The nucleic acid molecule is useful for preparing a composition for treating cancer. This sequence corresponds to a PCR to isolate and amplify one of the genes of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Measurement of nucleic acids, using a nucleic acid probe and analysis of

The sequences given in AAQ41826-61 represent sequences which are bound in an electrophoretic mobility shift assay (EMSA) by Myc. The isolated sequences contain the central E box core of CACGTG which binds very weakly with Myc homo-oligomers (C1 complex), but more tightly with Myc hetero-oligomers (C2 complex). The C2 complex requires a 26-29 kD factor in addition to Myc. The additional factor copurifies with Myc and resembles Max protein. A second copurifying 40-50 kD factor has been identified (forming C2 complex). Sites selected by the C2 complex contain the core CAGCTG which bears remarkable homology to a myogenin binding site (see AAQ41763). Oligonucleotides containing the E box can be used in the purification of Myc from a mammalian source. See also anyconinhibit c-Myc oncoprotein activity. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                            This invention relates to a method for measuring nucleic acids using a nucleic acid probe labelled with a fluorochrome. The nucleic acid probe decreases the fluorescence of the fluorochrome when hybridised with a target nucleic acid, the decrease in the fluorescence is measured. The method can be used for measuring a target nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Prodn. of c-Myc protein from mammalian cells - and detection of c Myc inhibitors for use in cancer therapy.

These ORFs encode polypeptides (see AAX36754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these
                                                                                                                                                                                                                                                                                                            Vaccine, eye disease, conventional trachoma, nonendemic trachoma, paratrachoma, inclusion conjunctivitis, genital disease, perihepatitis, nongonococcal uretritis, epidymitis, cervicitis, salpingitis, PCR primer, bartholinitis, pneumopathy, venereal lymphogranulomatosis, ss.

This sequence represents an antisense oligonucleotide sequence which targets a region of the human tumour necrosis factor alpha (TNFalpha) nucleotide sequence. TNFalpha is an important cytokine that plays a role in host defence. It is produced mainly in macrophages and monocytes in response to infection, invasion, injury or inflammation. Overexpression of TNFalpha can result in disease states, particularly in infectious, inflammatory and autoimmune diseases. The invention relates to antisense oligonucleotides, such as that represented by the present sequence which are capable of modulating the TNFalpha gene expression. The are capable of modulating the TNFalpha gene expression. The oligonucleotides are useful for modulating the expression of human treating a tesponse, reducing the blood glucose level in a human and treating a human having a disease or condition associated with TNFalpha. Examples of diseases associated with TNFalpha. Examples of diseases associated with TNFalpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               disease, multiple sclerosis, parcreatitis, rheumatoid arthritis, infectious disease, hepatitis, atopic dermatitis or allograft rejection. The antisense oligonucleotides are also useful for modulating the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8
                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents a PCR primer used to amplify intron 1 of the collagen I-alpha-1 gene. The PCR product is used in the method of the invention for determining susceptibility to bone damage. The method comprises screening for polymorphisms in the vitamin D receptor (VDR) gene or the Collagen I-alpha-1 gene. The the presence of alleles A and/or CC T, and especially the haplotype baT, are associated with an increased risk of bone damage and a higher risk of bone fracture. The methods are used for determining the susceptibility to bone damage and osteoporosis. Bone damage may be any form of structural damage, including fractures, comprease or chips. Identification of those at risk using the method of the invention, allows for preventative measures to be taken, such as modifications to lifestyle, regular exercise, and changes in diet to strengthen bones, and hormone therapy. The present invention allows diagnosis of those at risk of developing osteoporosis, and so allows more effective preventative measures to be taken

The invention relates to oligonucleotides used for detection or amplification of a gene selected from the group consisting of Vibrio parahaemolyticus direct haemolysin-related thermostable haemolysin genes (trhl and trh2) and V. parahaemolyticus thermostable direct haemolysin gene (tdh2) or RNA derived therefrom. These oligonucleotides are useful as probe and primer for detection or amplification of V. parahaemolyticus trh1, trh2 and tdh2 genes or RNA derived from the genes for clinical examination, public hygiene, food evaluation or food poisoning evaluation. The present sequence is a primer used to amplify V.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New oligonucleotides as primers and probes, useful for detection or amplification of Vibrio parahaemolyticus thermostable direct hemolysin-related hemolysin genes or RNA derived from them.

                                                                            Determining susceptibility of human patient to hereditary pancreatitis comprises analyzing nucleic acid from patient for presence of mutation in third exon of cationic trypsinogen gene that indicates hereditary pancreatitis.
                                                                                                                                                                                             The specification describes a method for determining whether a human patient is susceptible to hereditary pancreatitis (HP). The method comprises obtaining nucleic acid from the human patient and analysing the nucleic acid to identify the presence of a single G to A transition mutation in codon 117 in a third exon of a cationic trypsinogen gene, or a single A to T transition mutation at codon 21 in second exon of a cationic trypsinogen gene, that indicates HP. The method is useful for determining whether a human patient is susceptible to HP. The present sequence represents an oligonucleotide, which is used in the course of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tumour necrosis factor alpha; TNF-alpha; antiinflammatory; antirheumatic; antiarthritic; antidiabetic; dermatological; hepatotropic; antiasthmatic; inflammatory disorder; inflammatory bowel disease; Crohn's disease; colitis; rheumatoid arthritis; diabetes; pancreatitis; multiple sclerosis; atopic dermatitis; asthma; hepatitis; antisense technology; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               subject to bone damage comprise determining which allele(s) of polymorphisms in methyltetrahydrofolate reductase (MTHFR) and collagen lalphal are present in the subject, or measuring level of serum homocysteine in the subject, where elevated level compared to a reference population indicates susceptibility. Also included are determining the susceptibility to bone damage in a subject identified as having the
                                                                                                           The invention describes a method of treating an inflammatory disorder in an individual, comprising administering to the individual an oligonucleotide upto 30 nucleotides in length complementary to a nucleic acid molecule encoding human tumor necrosis factor (TNF)-alpha. The method is useful for treating an inflammatory disorder such as inflammatory bowel disease, Cohn's disease, colitis or rheumatoid arthritis, in an individual. The method is also useful for treating diabetes, pancreatitis, multiple sclerosis, atopic dermatitis, asthma, and hepatitis in an individual. This sequence represents an antisense oligonucleotide used to modulate expression of tumour necrosis factor
Crohn's disease or rheumatoid arthritis, in a subject, by administering oligonucleotide which inhibits expression of human tumor necrosis factor alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; 88; collagen IalphaI; SNP; single nucleotide polymorphism;

allele of the Spl polymorphism in collagen Ialphal, preventing or reducing susceptibility to bone damage in a subject (comprising prescribing or administering folic acid to a subject at risk for bone damage), preventing or reducing bone damage (comprising determining that a subject as increases susceptibility to bone damage, and prescribing or administering folic acid to the subject), and predicting response of a subject to treatment (comprising determining which alleles of the MTHFR and/or collagen Ialphal are present). The invention is useful to prevent or reduce risk of bone damage (e.g. osteoporosis) by treating subjects determined to be susceptible with folic acid. The present sequence is a PCR primer used to amplify the polymorphic region of the human collagen
                                                                                                                                                                                                                                                                                                                                            IalpĥaI gene.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid ubiquinone.

Disclosure; SEQ ID NO 2652; 872pp; English.

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive,

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating

Claim 15; SEQ ID NO 2652; 763pp; English.

ô
immunosuppressive, and cytostatic activity. The composition may have a use in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of ubiquinone or lung surfactant in a subject's tissue, or treating bronchoconstriction, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO

dysfunction or cancer and can be anti-sense to the corresponding mRNA.

C dysfunction or cancer and can be anti-sense to the corresponding mRNA.

C device, in separate containers, (b) the oligomucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiachmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition and/or lung or buildnamation, and/or bronchoconstriction and/or lung or inflammation, allergies and/or bronchoconstriction and/or lung or inflammation, allergies and/or bronchoconstriction and/or lung or inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary confistension, emphysema, chronic obstructive pulmonary disease, pulmonary confistension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense to prevent the breakdown of the uniquines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
expression of a target polypeptide associated with lung airway or lung

ö
The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention comprises an antisense oligonucleotides that are targeted to nucleic acids encoding a mammalian glucocorticoid receptor. The antisense oligonucleotides of the invention are useful for preventing or delaying infection, inflammation or tumour formation. The antisense oligonucleotides are also useful for treating diabetes, obesity, cardiovascular disorders, hyperlipidaemia or Cushing's syndrome. The present DNA sequence represents an antisense oligonucleotide that targets the human glucocorticoid receptor gene. NOTE: The present sequence contains 2'-methoxyethyl (2'-MOE) wings and a phosphorothioate backbone.
                                                                                                                                                                                                                                                                                                                                                                                              New antisense compound targeted to a nucleic acid molecule encoding mammalian glucocorticoid receptor, useful for treating diabetes, obesity, cardiovascular disorder, hyperlipidemia or Cushing's syndrome.

The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to antisense compounds, compositions and methods for modulating the expression of selenophosphate synthetase 2 (SPS2). The composition comprises antisense oligonucleotides targeted to SPS2 gene. The antisense oligonucleotide is useful for modulating the expression of SPS2 in cells or tissues to treat diseases associated with their expression, e.g. rheumatoid arthritis, infections, inflammation or tumours. It is also used for diagnostics, prophylaxis, or as research reagents or kits. The antisense oligonucleotide is useful in antisense therapy. The present sequence is an antisense oligonucleotide targeted to human SPS2 DNA. This sequence is used in the exemplification of the

/note= "Phosphorothioate backbone and all cytidines are 5
-methylcytidines"
New polynucleotide directed against the gene for telomerase catalytic subunit, useful for diagnosis and treatment of solid tumors and leukemia, interacts with specific regions of the mRNA.
                                                                                                                                                                                                                                                                                                                                                               least two target sequence regions, i.e. 2176-2250 and 2296-2392 of the sequence AF015950. The polynucleotides are used for diagnosis, prophylaxis, treatment, monitoring (of progression or therapy) and/or secondary treatment of diseases associated with growth, differentiation and/or division of cells, especially a very wide range of solid cancers and leukaemia, or their metastases, e.g. cancers of the urogenital or gastrointestinal tracts, liver, breast, prostate and bladder. They can also be used to inhibit vitality or proliferation rates of cells, to induce apoptosis and/or cause cell-cycle arrest. The present sequence is an oligonucleotide used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  death-associated protein kinase-rel. apoptosis-inducing protein kinase; serine/threonine kinase 17B; STK17B; apoptosis; degenerative disorder; neurological disorder; Alzheimer's disease; Parkinson's disease; Amylotrophic lateral sclerosis; ALS; retinitis pigmentosa; blood cell disorder; cancer; autoimmune disorder; viral infection; gene therapy; hyperproliferative disorder; chromosome 2.
                                                                                                                                                                                                                                             The present invention relates to a polynucleotide, directed against a gene that encodes a catalytic subunit of human telomerase, which interacts with the mRNA of the catalytic subunit of telomerase in at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  g
                                                                                                                                                                 The invention relates to a new compound (e.g. an antisense oligonuclectide), having a sequence comprising 8-80 bp targeted to a nucleic acid encoding DRAK2 (death-associated protein kinase-related apoptosis-inducing protein kinase 2, also known as serine/threonine kinase 17B, STK17B), specifically hybridises with the nucleic acid encoding DRAK2 (appearing as ADP68859 and representing bases 58695-149492 of human chromosome 2) and inhibits expression of DRAK2. Also included are inhibiting the expression of DRAK2 in cells or tissues, screening for a modulator of DRAK2, a diagnostic method for identifying a disease create, a kit or assay device comprising the compound and treating an animal having a disease or condition associated with DRAK2. The oligonucleotide compound is useful for preparing a composition for treating hyperproliferative disorders, degenerative disorders, neurological disorders, Alzheimer's disease, Parkinson's disease, Amylotrophic lateral sclerosis (ALS), retinitis pigmentosa, blood cell disorders, cancer, autoimmune disorders and viral infection. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                     ulsorders, cancer, autoimmune disorders and viral infection. The present sequence represents an antisense oligonucleotide targeting DRAK2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    antimicrobial; antidiabetic; antirheumatic; antiarthritic; gastrointestinal; antiinflammatory; neuroprotective; dermatological; virucide; hepatotropic; human; TNF-alpha; tumour necrosis factor alpha; survivin; TNF-alpha associated disorder; infection; diabetes; rheumatoid arthritis; Crohn's disease; pancreatitis; multiple sclerosis; atopic dermatitis; hepatitis; antisense oligonucleotide; antisense technology; ss.

Also described is a double stranded RNA compound having a fully defined sequence of 20 bp (SEQ ID NO: 432) as given in the specification. Also disclosed are TNF-alpha polypeptides, host cells, vectors and antibodies used in the methods of the invention. The methods and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of TNF-alpha, such as infection, diabetes, rheumatoid arthritis, Crohn's disease, pancreatitis, multiple sclerosis, atopic dermatitis and hepatitis. This sequence represents a human tumour
                                                                                                                                                                                                                                                            New double stranded RNA compound inhibiting expression of human TNF-alpha and survivin, useful for diagnosing, preventing or treating infection, diabetes, arthritis, multiple sclerosis and hepatitis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; tumour necrosis factor alpha; TNFalpha; ss;
antisense gene therapy; inflammatory disorder; phosphorothioate linkage;
methylene(methylimino) intersugar linkage; infection; autoimmune disease;
diabetes; rheumatoid arthritis; Crohn's disease; pancreatitis;
multiple sclerosis; atopic dermatitis; inflammatory bowel disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense oligonucleotide targeting human TNFalpha ISIS100606
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            necrosis factor alpha (TNF-alpha) antisense oligonucleotide

This sequence represents a primer which was used in the quantitation of the distribution of prostaglandin E2 EP3 III polypeptide. The prostaglandin E2 EP3 III polypeptide and corresponding nucleic acid may be used for screening therapeutic agents for treating disease such as hematological diseases, cardiovascular disease, urological diseases, andocrinological diseases, urological diseases, comprise detecting binding of a test compound to a prostaglandin E2 EP3 III polypeptide or polynucleotide, determining activity of prostaglandin E2 EP3 III polypeptide in the presence of a regulator of prostaglandin E2 EP3 III polypeptide. The regulators of prostaglandin E2 EP3 III polypeptide in the pharmaceutical composition for treating disease such as hematological diseases, cardiovascular disease, urological diseases, metabolic diseases, endocrinological diseases, urological diseases, metabolic cancer, or respiratory diseases in a mammal. They are also useful for the regulation of prostaglandin E2 EP3 III activity in a mammal having the
                                                                                                                                                                                                                                                                                                                                                            Screening agents for treating, e.g., cancer by detecting binding of compound to prostaglandin E2 EP3 III protein or polynucleotide, determining activity of E2 EP3 III in presence of regulator and/or compound at varying concentrations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Match 0.4%; Score 15.4; DB 1; Length 20; Local Similarity 94.1%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to treating an inflammatory disorder in an individual comprising administering an oligonuclectide (an antisense coligonuclectide) up to 30 nuclectides in length complementary to a nucleic acid molecule encoding human tumour necrosis factor-alpha (TNF-alpha). The oligonuclectide useful in treating an inflammatory disorder inhibits the expression of the human tumour necrosis factor-alpha, and comprises at least an 8 nucleobase portion of any of 50 20-21 base pair sequences, given in the specification. The antisense oligonuclectide is administered orally, topically or parenterally. The oligonuclectide comprises at least one modified intersugar linkage. The intersugar comprises at least one 2'-O-methoxyethyl modification and at least one 5-methyl cytidine, where every 2'-O-methoxyethyl modification and at least one 5-methyl cytidine, where every 2'-O-methoxyethyl modified cytidine residue is a 5-methyl cytidine. The modified intersugar linkage is a methylene (methylimino) intersugar linkage. The modified is a 5-methyl cytidine. The modified and compositions of the present invention are useful for the diagnosis, prevention and/or treatment of diseases or conditions associated with aberrant expression or activity of the TNF-alpha, such as inflammatory, infectious and autoimmune disease, pancreatitis, including diabetes, rheumatoid arthritis, crohn's disease, pancreatitis, unlippe sclerosis, atopic dermatitis, inflammatory bowel disease, colitis and hepatitis. The present sequence is an antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                         Treating inflammatory disorders, such as diabetes, rheumatoid arthritis and multiple sclerosis, using antisense oligonucleotides targeted to nucleic acids encoding human tumor necrosis factor-alpha (TNF-alpha).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                .

                                                                                                                                                                                                                                                                                                                                                                                               S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                 DNA or RNA was purified from white blood cells of patients with acute leukaemia or solid tumour cells; the RNA was reverse transcribed into cDNA. The downstream primer (AAQ21515) was used together with this primer which has a mutant-specific nucleotide at its 3' end to amplify a region of exon 4 of the CTP synthetase gene. A specific signal will only be seen with samples contg. the mutant gene. See AAQ21488 and AAQ21512 for upstream primers which can be used with other primers specific for mutations in exon 4. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DNA encoding cpds. which catalyse de-acetylation - and sulphation of glycosamino-glycan(s), used to develop agonists or antagonists for use in
                                                                                                                                                                                                               Assay method for CTP synthetase mutation(s) - utilising polymerase chain reaction to reveal the presence of the multiple drug resistance phenotype indicative of a mutation.

                                                    N-heparan sulphate sulphotransferase can catalyse the deacetylation and sulphation of a glycosaminoglycan (GAG), namely heparan sulphate. It can be used for treating conditions in which the stimulation or inhibition of the deacetylation and or sulphation of heparan is desirable, such as blood clotting disorders, neoplastic conditions and viral infection. The enzyme can also be used to produce highly modified and therefore highly active sulphated proteoglycans for use in therapy. This primer was used to amplify a subclone of the enzyme coding sequence to produce a probe. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Diagnosis of X-linked severe combined immunodeficiency (XSCID) - comprises detecting mutated IL-2R gamma gene, also vectors and transgenic animals containing the mutated gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Were used to amplify DNA from mutated and normal IL-2R gammma gene, these were used to amplify DNA from mutated and normal IL-2R gamma genes. The mutated gene DNA was obtained either from female carriers or male sufferers of X-linked severe combined immunodeficiency (XSCID). The amplified DNA from normal and affected individuals was then compared using a variety of methods including northern blotting and dot and slot hybridisation. From this a claimed method for the diagnosis of XSCID carriers and sufferers was developed. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     gene; X-linked severe combined immunodeficiency; XSCID;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The method aims to provide a collection of highly reproducible microsatellite marker sequences (MMS) at approx. 10-50 cM intervals throughout the human genome which can be detectably labelled. The MMS are polymorphic, simple sequence repeats and can be used in automated genotyping. esp. fluorescence-based. The primers correspond to the unique DNA sequence surrounding each marker, and PCR is used to detect each polymorphism. When the MMS show considerable polymorphism (ie. a difference in the number of repeats) between individuals, the markers can be particularly informative. The MMS can be ideal for linkage studies. Kits comprise at least 4 groups, of at least 3 sets, each comprising labelled primers for PCR amplification of the DNA. Group 7 primer pairs are shown in AAQ95687-734. The published size range of the D155118 allele is 218-230 bp, and the degree of heterozygosity in the population is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Kit for automated genotyping contg. pairs of PCR primers - designed to amplify polymorphic nucleotide repeat sequences, arranged in sets each with a characteristic fluorescence label, useful e.g. in detection of disease related genetic rearrangement.

AAT47264-T47280 represent capped RNA molecules produced by the method of the invention is for producing capped RNA or the invention. The method of the invention is for producing capped RNA or RNA analogues. The method comprises reacting a RNA or analogue oligonucleotide with a phosphate addition agent to form a RNA or analogue coligonucleotide with a phosphate addition agent to form a RNA or analogue is important for mRNA maturation, initiation of translation, and protects the mRNA against various RNases present in the cell. The capped RNA or analogue is an influenza endonuclease aptamer, useful for treating or preventing an influenza infection in an animal. The synthetic capped RNA are substrates for virally encoded endonuclease associated with influenza virus. The short non-extendible (due to their length or because of the modification of the 3' end of the oligo) RNA molecules are potent inhibitors of the cleavage of capped RNA by influenza endonuclease. They may be used to investigate viral and cellular mechanisms of translation, or mRNA maturation
                                                                                                               Capped RNA molecule; mRNA maturation; translation initiation; influenza; endonuclease aptamer; RNase; therapy; inhibitor; ss.

Classification of the genotype of HCV can be achieved precisely and simply according to the International Standardisation of Classification. The primers can be used to distinguish between HCV genotypes 1a, 1b, 2a, 2b, 3a, 3b, 4, 5a, 6a and 6b
                                                                                                                                                                                                                                       Primers used for determining hepatitis C virus genotype - provide a rapid and accurate method of hepatitis C virus genotyping.

This is carried out by separating the wild type alleles using a carrier on which are bound one or more oligonucleotides complementary to the wild type. The method is used to detect mutants having one or more point mutations, deletions, inversions, insertions and/or substitutions of small or large genetic regions, particularly to detect genetic abnormalities for cancer diagnosis. The method can detect cancer cells in faeces, sputum, bronchial lavage, urine or tissue biopsies. Rare alleles can be detected, making the method suitable for detecting heterozygous or homozygous mutations or polymorphisms of any origin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Vaccine, eye disease, conventional trachoma, nonendemic trachoma; paratrachoma, inclusion conjunctivitis, genital disease, perihepatitis, nongonococcal uretritis, epidymitis, cervicitis, salpingitis, PCR primer, bartholinitis, pneumopathy, venereal lymphogranulomatosis, ss.
                                                                             Detecting mutated alleles in presence of excess wild-type allele - by separation of wild-type on support carrying specific oligonucleotides, used to detect mutation(s), particularly for cancer diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

        PCR primers AA201426-206209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AA201425). These ORFs encode polypeptides (see AA316754-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.

coligonucleotides targetted to the human MEKKS gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human MEKKS RNA, and were analysed for their effect on MEKKS mRNA levels by quantitative real-time PCR. MEKKS (also known as mitogen-activated protein kinase kinase S, MEK kinase S, MEK kinase S, apoptosis signal-regulating kinase S, MEK kinase S, apoptosis signal-regulating kinase S, MEK kinase S, apoptosis signal-regulating kinase I, and ASKI) is a dual-specific serine/threonine kinase which mediates cellular responses to mitogenic stimuli by activating both the JNK/SAPK (Jun N-terminal kinase/stress-activated protein kinase) and p38 modules of MAP kinase cascades. MEKKS is thought to play a critical role in the regulation of apoptosis (programmed cell death) by interacting with other regulation of apoptosis (programmed cell death) by interacting with other credulation and sextlement of MEKKS is induced by tumour necrosis factor as MKX3 and SEKI. MEKKS also participates in another apoptosis-related signalling cascade involving the modulation of transcription factors. Activation and dimerisation of MEKKS is induced by tumour necrosis factor alpha (TNF-alpha), these processes being mediated by reactive oxygen capecies. Thioredoxin is able to associate with MEKKS and inhibit MEKKS kinase activity and hence MEKKS-dependent apoptosis. The oligonucleotides conditions associated with MEKKS expression, such as inflammation and conditions and mealing disorders

.

AAX91991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584- AAX35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae

Novel compound for diagnosing, preventing and treating immune disorders, comprising an oligonuclectide that specifically hybridizes with a nucleic acid sequence encoding B7 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention provides sequences of antisense oligonucleotides targeted at the murine and human B7-1 and B7-2 coding and mRNA sequences. The antisense sequences have phosphorothicate backbones and some nucleotides are 2'-methoxyethoxy residues. The sequences can be used in the treatment of inflammatory and autoimmune disorders, including asthma, juvenile diabetes mellitus, myasthenia gravis, Graves' disease, rheumatoid arthritis, allograft rejection, inflammatory bowel disease, rheumatoid sclerosis, psoriasis, systemic lupus erythematosus, contact dermatitis, rhinitis, allergies and cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; ATM; ataxia telangiectasia; mutation detection;

The antisense sequences have phosphorothicate backbones and some nucleotides are 2'-methoxyethoxy residues. The sequences can be used in the treatment of inflammatory and autoimmune disorders, including asthma, juvenile diabetes mellitus, myasthenia gravis, Graves' disease, rheumatoid arthritis, allograft rejection, inflammatory bowel disease, multiple sclerosis, psoriasis, systemic lupus erythematosus, contact
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel compound for diagnosing, preventing and treating immune disorders, comprising an oligonucleotide that specifically hybridizes with a nucleic acid sequence encoding B7 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                   Gaps

The present sequence is one of a number of primers used in a method for detecting a mutation or a polymorphism in the human ATM gene, which is associated with the disease ataxia telangiectasia, or a polyexonic cukaryotic gene of at least 4 kb. The method uses an improved version of single-stranded conformation polymorphism (SSCP) electrophoresis that allows electrophoresis of two or three amplified segments in a single lane. The method is useful for screening large, complex polyexonic cukaryotic genes such as the ATM gene for mutations and polymorphisms in the ATM gene are useful for performing more accurate screening of human DNA samples for mutations, for distinguishing mutations from polymorphisms, and for improving the efficiency of automated screening methods. The mega-SSCP method provides a screening method of genes for multiple polymorphisms and mutations at once. The method is particularly suitable for large, polyexonic, eukaryotic genes, having mutations and polymorphisms at many points and not merely at one or a few hot spots. Note: the SEQ ID assigned to this sequence in the disclosure and claims of the the specification is one
                                                                                                                                                                                                                                              Detecting a mutation or polymorphism in human ataxia telangiectasia gene or polyexonic eukaryotic gene, involves using mega-single stranded comformation polymorphism analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human nucleolin phosphorothioate antisense oligonucleotide, SEQ ID NO:51.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human nucleolin; P92; C23; phosphoprotein; ribosome biogenesis; ribosome transport; cytokinesis; nucleogenesis; cell proliferation; cell growth; transcriptional repression; replication; signal transduction; chromatin decondensation; Ag-NOR family; nucleolin antibody; systemic connective tissue disease; SLE; systemic lupus erythematosus; scleroderma-like chronic graft versus host disease;

Sequences AAC92560-C92639 represent antisense oligomucleotides targetted to the human nucleolin gene, which inhibit its expression. The antisense oligomucleotides were designed to target different regions of the human nucleolin mana mucleolin mana, and were analysed for their effect on nucleolin mana for levels by quantitative real-time PCR. Nucleolin (also known as P92 or 1923) is the most abundant nucleolar phosphoprotein in actively growing cells. Nucleolin primarily participates in ribosome biogenesis and transport of ribosomal components, being able to transiently bind to preciposomes in the nucleolus via a ribonucleoprotein consensus sequence. However, it has also been shown to be involved in cytokinesis, cell proliferation and growth, transcriptional repression, creplication, signal transduction, and chromatin decondensation. Nucleolin is a member of the Ag-NOR (active ribosomal gene located in the nucleolar creplication, signal transduction, and chromatin decondensation. Nucleolin is a member of the Ag-NOR (active ribosomal gene located in the nucleolar organiser region) family of proteins which are markers of active ribosomal genes, and whose expression is associated with the prediction of tumour growth rate. The presence of antibodies against nucleolin are associated with systemic connective tissue diseases such as systemic connective tissue diseases such as systemic connective tissue diseases such as systemic connective tissue diseases. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with nucleolin expression, such as tumour formation, immune disorders and inflammation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense gene therapy, RAIDD; death domain; caspase recruitment domain; CARD; hyperproliferative disorder; cancer; growth disorder; mouse; metabolic disorder; infection; inflammation; tumour formation; RIP associated ICH-1/CED-3-homologous protein with death domain; receptor interacting protein; antisense oligonucleotide; ss.
                                                                                                                          Novel antisense compound targeted to human nucleolin which specifically hybridizes with and inhibits the expression of human nucleolin, useful for modulating the expression of nucleolin in cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

The invention describes a compound (I) 8-50 nucleobases in length
targeted to a nucleic acid molecule (II) encoding RAIDD which is an
adaptor molecule containing both death domain (DD) and caspase
recruitment domains (CARD), where (I) specifically hybridises with at least an
inhibits expression of RAIDD, or specifically hybridises with at least an
continuous portion of an active site on (II). (I) is useful for
inhibiting the expression of RAIDD (Receptor interacting protein (RIP)
associated ICH-1/CED-3-homologous protein with death domain) in cells or
tissues, and for treating an animal having a disease or condition
consistent and for treating an animal having a disease or condition
consistent and for treating an animal having a disease or condition
consistent and kalbD, where the disease or condition is a
hyperproliferative disorder such as cancer, or a growth or metabolic
disorder. (I) is also useful for disquostics, therapeutics, prophylaxis,
as research reagents and kits, for distinguishing functions of various
members of a biological pathway, and in antisense gene therapy. (I) is
also useful prophylactically, e.g. to prevent or delay infection,
inflammation or tumour formation. This sequence represents a mouse RAIDD
control expression of the RAIDD protein

The invention relates to a DNA marker associated with obesity and a predictive method of the likelihood of obesity using the DNA marker are provided, used in inhibiting obesity effectively in preventive medicine.

The DNA marker associated with obesity has the nucleotide sequence of human LPL (lipoprotein lipase) wherein a 6th base from the origin (+1) of exon 4 in intron 3 of the human LPL is changed from C to T, wherein the base-substituted nucleotide sequence of human LPL comprises a C type allele gene with a MboII restriction enzyme-recognition and a T type allele gene without the MboII restriction enzyme-recognition of: collecting DNA from a human blood sample; amplifying a region of the intron 3 of the LPL gene in a DNA sample containing a region from -6 to -11 bases at the origin of the exon 4 by PCR; digesting the amplified DNA with MboII; and determining the gene type of the blood sample based on the band size of a digested DNA fragment. The present sequence is a PCR primer used in the above method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Genetically modified yeast strain; autonomous; metabolism of cholesterol; 17alpha-hydroxypregnenolone; steroid; cortisol; cortexolone; 17alpha-hydroxyprogesterone; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New genetically modified yeast, useful for producing therapeutic steroids
from simple carbon source, provide high yields at low cost.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a genetically modified yeast strain that produces, autonomously from a simple carbon source, a steroid, or its derivative, formed by metabolism of cholesterol. The steroid is 17alphahydroxyprogesterone. The genetically modified yeast strain is used to produce therapeutically useful steroids, and can itself be used as a pharmaceutical. This polynucleotide sequence represents an oligonucleotide relating to the steroid producing genetically modified yeast strain of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ä

The present invention describes a method (M1) for designing capture oligonuclectide probes (I) for use on a support to which complementary oligonuclectide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Cryptococcus neoformans, Candida albicans and Aspergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, Epstein-Barr virus and polio virus, and parasitic infectious agents medinesis. The method is also useful for detecting genetic diseases such medinesis. The method is also useful for detecting genetic diseases such can buy amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCAl gene, ps3 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food method is also used for environmental monitoring, forensics and the food
                                                                     ö

The oligonucleotides were designed to target different regions of human CREB mRNA, and were analysed for their effect on CREB expression by quantitative real-time PCR. CREB (also known as CREB1) is a member of the basic leucine zipper (bZIP) family of transcription factors, and activates transcription of target genes in response to a diverse array of stimuli including peptide hormones, growth factors and protein kinases. It is a component of intracellular signalling events which regulate a wide variety of biological functions,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New antisense oligonucleotides for modulating CREB (cAMP response elemen binding protein) gene expression, useful for preventing or treating e.g. cancers, a disease arising from aberrant apoptosis, or neuronal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g 5-

ò
including spermatogenesis, circadian rhythms and memory. Overexpression of CREB has been found to induce apoptosis in certain cells, although CREB overexpression may also be linked to cancer as it is constitutively activated in human somatotroph adenomas. CREB may also play a role in the development of drug dependency, as it has been found to mediate morphine-induced upregulation of the cAMP pathways that contribute to opiate dependency. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of CREB-related disorders, such as hyperproliferative disorders (particularly cancer, e.g., those of blood and soft tissue), diseases or conditions arising from aberrant apoptosis, or neuronal disorders. The present sequence represents a human H-ras phosphorothicate antisense oligonucleotide used as a positive control in the discrement of the concentration for a particular cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New antisense oligonucleotides for modulating vitamin D nuclear receptor gene expression, particularly useful for treating or preventing cancer or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /mod_base= OTHER
/note= "This oligonucleotide has a phosphorothioate
backbone and 2-'methyoxyethyl (2'-MOE) wings at the 5'
and 3' ends, which are 5 nucleotides in length. Also all
